

Summary: P229 #1-4,5-23

P229

1)

This simplifies calculations, as the molar masses of the compound, and that of the elements can be used to calculate percentage composition data.

2)

It is exactly the same as water found in nature, as all water has the same formula,  $\text{H}_2\text{O}$ , regardless of how it was created in the first place.

3)

a) Masses of  $\text{CO}_2$  and  $\text{H}_2\text{O}$  generated during the combustion, as well as the mass of the original hydrocarbon burned.

b) Their results would be the same, and the C-H combustion analyzer provides data that can be used to calculate an empirical formula, not a molecular formula. Additional information obtained through other means is needed to calculate a molecular formula.

4)

No, there is not enough information to get an empirical formula in the first place, as the mole ratios of the elements must be known.

$$5) M(\text{Na}_2\text{B}_4\text{O}_7) \cdot 10\text{H}_2\text{O} = 381.42 \text{ g/mol}$$

$$n(\text{Na}_2\text{B}_4\text{O}_7) = 5.00 \text{ g} \div 381.42 \text{ g/mol} = 0.0131 \text{ mol}$$

$$\text{therefore } n(\text{H}_2\text{O}) = 10 \times 0.0131 \text{ mol} = 0.131 \text{ mol}$$

$$m(\text{H}_2\text{O}) = 0.131 \text{ mol} \times 18.02 \text{ g/mol} = 2.36 \text{ g}$$

$$\text{therefore } m(\text{Na}_2\text{B}_4\text{O}_7) = 5.00 \text{ g} - 2.36 \text{ g} = 2.64 \text{ g}$$

6)

$$a) M(\text{CCl}_2\text{F}_2) = 120.91 \text{ g/mol}$$

$$\% \text{cm (C)} = 12.01 \text{ g/mol} \div 120.91 \text{ g/mol} \times 100\% = 9.93 \%$$

$$\% \text{cm (Cl)} = 2 \times 35.45 \text{ g/mol} \div 120.91 \text{ g/mol} \times 100\% = 58.6\%$$

$$\% \text{cm (F)} = 2 \times 19.00 \text{ g/mol} \div 120.91 \text{ g/mol} \times 100\% = 31.4\%$$

$$b) M[\text{Pb}_3(\text{OH})_2(\text{CO}_3)_2] = 776.15 \text{ g/mol}$$

$$\% \text{cm (Pb)} = 3 \times 207.37 \text{ g/mol} \div 776.15 \text{ g/mol} \times 100\% = 80.2\%$$

$$\% \text{cm (O)} = 8 \times 16.00 \text{ g/mol} \div 776.15 \text{ g/mol} \times 100\% = 16.5\%$$

$$\% \text{cm (H)} = 2 \times 1.01 \text{ g/mol} \div 776.15 \text{ g/mol} \times 100\% = 0.260\%$$

$$\% \text{cm (C)} = 2 \times 12.01 \text{ g/mol} \div 776.15 \text{ g/mol} \times 100\% = 3.09\%$$

7)

$$a) M(\text{MgCl}_2 \cdot 2\text{H}_2\text{O}) = 131.25 \text{ g/mol}$$

$$n(\text{MgCl}_2 \cdot 2\text{H}_2\text{O}) = 25.00 \text{ g} \div 131.25 \text{ g/mol} = 0.1905 \text{ mol}$$

$$n(\text{H}_2\text{O}) = 2 \times 0.1905 \text{ mol} = 0.3810 \text{ mol}$$

$$m(\text{H}_2\text{O}) = 0.3810 \text{ mol} \times 18.02 \text{ g/mol} = 6.866 \text{ g}$$

$$b) M(\text{KMnO}_4) = 158.04 \text{ g/mol}$$

$$\% \text{cm} (\text{Mn}) = 54.94 \text{ g/mol} \div 158.04 \text{ g/mol} \times 100\% = 34.76\%$$

$$m(\text{Mn}) = 34.76\% \times 5.00 \text{ g} = 1.74 \text{ g}$$

8)

$$a) M(\text{AgNO}_3) = 169.88 \text{ g/mol}$$

$$\% \text{cm} (\text{Ag}) = 107.87 \text{ g/mol} \div 169.88 \text{ g/mol} \times 100\% = 63.50\%$$

$$b) m(\text{Ag}) = 63.50\% \times 2.00 \times 10^2 \text{ kg} = 127 \text{ kg}$$

9)

$$M(\text{BaSO}_4) = 233.40 \text{ g/mol}$$

$$\% \text{cm} (\text{Ba}) = 137.33 \text{ g/mol} \div 233.40 \text{ g/mol} \times 100\% = 58.84\%$$

$$m(\text{Ba}) = 58.84\% \times 45.8 \text{ g} = 26.9 \text{ g}$$

10)

$$M[\text{Bi}(\text{NO}_3)_3] = 333.00 \text{ g/mol}$$

$$\% \text{cm} (\text{Bi}) = 208.98 \text{ g/mol} \div 333.00 \text{ g/mol} \times 100\% = 62.76\%$$

$$m(\text{Bi}) = 62.76\% \times 268 \text{ g} = 168 \text{ g}$$

11)

$$M(\text{Empirical}) = 30.03 \text{ g/mol}$$

$$M(\text{Molecular}) \div M(\text{Empirical}) = 121 \text{ g/mol} \div 30.03 \text{ g/mol} = 4$$

$$\text{Therefore, molecular formula is } 4(\text{CH}_2\text{O}) = \text{C}_4\text{H}_8\text{O}_4$$

12)

$$M(\text{C}_6\text{H}_2\text{OCl}_2) = 160.98 \text{ g/mol}$$

$$M(\text{Molecular}) \div M(\text{Empirical}) = 322 \text{ g/mol} \div 160.98 \text{ g/mol} = 2$$

$$\text{Therefore, molecular formula is } 2(\text{C}_6\text{H}_2\text{OCl}_2) = \text{C}_{12}\text{H}_4\text{O}_2\text{Cl}_4$$

13)

a) A formula cannot have a fractional subscript, as this implies fractional atoms in a formula.

$$b) \text{empirical formula} = 3(\text{CH}_{2.67}) = \text{C}_3\text{H}_8$$

14)

Element	Mass (%)	M(g/mol)	n(mol)	mole ratio	mole ratio in whole numbers
C	80.2	12.01	6.67	10.5	21
H	9.62	1.01	9.54	15	30
O	10.18	16.00	0.636	1	2

Therefore, the empirical formula of progesterone is  $C_{21}H_{30}O_2$

15)

Element	Mass (%)	M(g/mol)	n(mol)	mole ratio	mole ratio in whole numbers
Na	17.6	22.99	0.766	1	2
Cr	39.7	52.00	0.763	1	2
O	42.8	16.00	2.67	3.5	7

Therefore, the empirical formula is  $Na_2Cr_2O_7$

16)

Element	Mass (%)	M(g/mol)	n(mol)	mole ratio	mole ratio in whole numbers
Hg	67.6	200.59	0.337	1	1
S	10.8	32.07	0.337	1	1
O	21.6	16.00	2.00	4	4

Therefore, the empirical formula is  $HgSO_4$

17)

a)

Element	Mass (%)	M(g/mol)	n(mol)	mole ratio	mole ratio in whole numbers
Ca	38.8	40.08	0.968	1.5	3
P	20.0	30.97	0.646	1	2
O	41.2	16.00	2.575	4	8

Therefore, the empirical formula is  $\text{Ca}_3\text{P}_2\text{O}_8$

b) Since each formula unit as 2 P, and so does the empirical formula, the molecular formula is most likely the same. It is more recognizable as  $\text{Ca}_3(\text{PO}_4)_2$ .

18)

a)

Element	Mass (%)	M(g/mol)	n(mol)	mole ratio	mole ratio in whole numbers
C	71.0	12.01	5.91	18	18
H	8.60	1.01	8.51	26	26
O	15.8	16.00	0.988	3	3
N	4.60	14.01	0.328	1	1

Therefore, the empirical formula of Capsaicin is  $\text{C}_{18}\text{H}_{26}\text{O}_3\text{N}$

b) Since both the empirical and molecular formulas contain one N, the molecular formula is the same as the empirical formula  $\text{C}_{18}\text{H}_{26}\text{O}_3\text{N}$ .

19)

Create a table as for empirical formula and work backwards to determine the molar mass of X, therefore identifying it.

Element	Mass (%)	M(g/mol)	n(mol)	mole ratio	mole ratio in whole numbers
X	56.00	??????	1.1	2	2
O	44.00	16.00	2.75	5	5

Therefore,  $M = 56.00\text{g} \div 1.1 \text{ mol} = 50.91$ .

V, with a  $M=50.94$ , is the closest. A formula of  $\text{V}_2\text{O}_5$  is a valid formula!

20)

$$m(\text{H from HCl}) = 4.730\text{g} \times 1.01\text{g/mol} \div 36.46 \text{ g/mol} = 0.131 \text{ g}$$

$$m(\text{C from CCl}_4) = 9.977\text{g} \times 12.01 \text{ g/mol} \div 153.81 \text{ g/mol} = 0.7790 \text{ g}$$

$$m(\text{O}) = 1.254 \text{ g} - 0.131 \text{ g} - 0.7790 \text{ g} = 0.344 \text{ g}$$

Element	Mass (g)	M(g/mol)	n(mol)	mole ratio	mole ratio in whole numbers
C	0.7790	12.01	0.06486	3	3
H	0.131	1.01	0.130	6	6
O	0.344	16.00	0.0215	1	1

Therefore, the empirical formula is  $\text{C}_3\text{H}_6\text{O}$

21)

$$m(\text{FeSO}_4) = 1.52 \text{ g}$$

$$n(\text{FeSO}_4) = 1.52 \text{ g} \div 151.92 \text{ g/mol} = 0.0100 \text{ mol}$$

$$m(\text{H}_2\text{O}) = 2.78 \text{ g} - 1.52 \text{ g} = 1.26 \text{ g}$$

$$n(\text{H}_2\text{O}) = 1.26 \text{ g} \div 18.02 \text{ g/mol} = 0.0699$$

$$\text{mole ratio} = 7:1$$

Therefore, there are 7 water molecules for every formula unit of iron(II) sulfate.

22)

a)

$$m(\text{C}) \text{ from CO}_2 = 0.6871 \text{ g} \times 12.01 \text{ g/mol} \div 44.01 \text{ g/mol} = 0.1875 \text{ g}$$

$$m(\text{H}) \text{ from H}_2\text{O} = 0.1874 \text{ g} \times 2.02 \text{ g/mol} \div 18.02 \text{ g/mol} = 0.02101 \text{ g}$$

$$m(\text{O}) = 0.5000 \text{ g} - 0.1875 \text{ g} - 0.02101 \text{ g} = 0.2915 \text{ g}$$

$$\% \text{cm (C)} = 0.1875 \text{ g} / 0.5000 \text{ g} \times 100\% = 37.50\%$$

$$\% \text{cm (H)} = 0.02101 \text{ g} / 0.5000 \text{ g} \times 100\% = 4.202\%$$

$$\% \text{cm (O)} = 0.2915 \text{ g} / 0.5000 \text{ g} \times 100\% = 58.30\%$$

b)

Element	Mass (g)	M(g/mol)	n(mol)	mole ratio	mole ratio in whole numbers
C	0.1875	12.01	0.01561	1	6
H	0.02101	1.01	0.02081	1.33	8
O	0.2915	16.00	0.01822	1.167	7

Therefore, empirical formula of citric acid is  $\text{C}_6\text{H}_8\text{O}_7$

c)  $M(\text{empirical}) = 192.14 \text{ g/mol}$

$M(\text{molecular}) = 192 \text{ g/mol}$

Therefore, molecular formula of citric acid is  $\text{C}_6\text{H}_8\text{O}_7$ .

23)

$M(\text{methanol}) = 32.05 \text{ g/mol}$

$\% \text{cm (C)} = 12.01 \text{ g/mol} \div 32.05 \text{ g/mol} \times 100\% = 37.47\%$

$\% \text{cm (H)} = 4.04 \text{ g/mol} \div 32.05 \text{ g/mol} \times 100\% = 12.61\%$

$\% \text{cm (O)} = 16.00 \text{ g/mol} \div 32.05 \text{ g/mol} \times 100\% = 49.92\%$

$m(\text{C}) \text{ in methanol} = 1.00\text{g} \times 37.47\% = 0.3747 \text{ g}$

$m(\text{H}) \text{ in methanol} = 1.00\text{g} \times 12.61\% = 0.1261 \text{ g}$

therefore,

$m(\text{CO}_2) = 0.3747\text{g} \times 44.01 \text{ g/mol} \div 12.01 \text{ g/mol} = 1.373 \text{ g}$

$m(\text{H}_2\text{O}) = 0.1261 \text{ g} \times 18.02 \text{ g/mol} \div 2.02 \text{ g/mol} = 1.125 \text{ g}$
